## 3.3 W Mono Filterless Class D Audio power Amplifier

## **FEATURES**

- 3.3 W Into  $4\Omega$  from 5.5V power supply at THD+N = 10% (Typ.).
- 2.0 W Into 8Ω from 5.5V power supply at THD+N = 10% (Typ.).
- 2.5V~5.5V Power supply.
- Low shutdown current.
- Low quiescent current.
- Minimum external components.
- No output filter required for inductive loads.
- Output pin short-circuit protection and automatic recovery.
   (short to output pin, short to GND, short to VDD).
- Low noise during turn-on and turn-off transitions.
- Lead free and green package available. (RoHS Compliant)
- 8-pin MSOP package.

## **GENERAL DESCRIPTION**

The LY8005 is a high efficiency, 3.3 W mono class D audio power amplifier. It is a low noise, filterless PWM architecture eliminates the output filter, reducing external component count, system cost, and simplify design.

The LY8005 is designed to meet of portable electronic devices. The LY8005 is a single 5.5V power supply, it is capable of driving  $4\Omega$  speaker load at a continuous average output of 3.3 W with 10% THD+N.

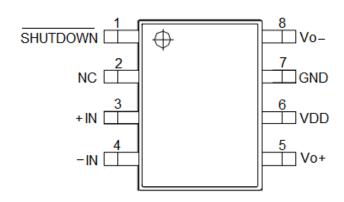

In cellular handsets, the earpiece, speaker phone, and melody ringer can each be driven by the LY8005. The gain of the LY8005 is externally configurable which allows independent gain control from multiple sources by summing the signals. Output short circuit and thermal overload protection prevent the device from damage during fault conditions.

#### **APPLICATION**

- Portable electronic devices
- Mobile Phones
- PDAs

## 3.3 W Mono Filterless Class D Audio power Amplifier

#### APPLICATION INFORMATION

#### **Fully Differential Amplifier**

The LY8005 is a fully differential amplifier with differential inputs and outputs. The fully differential amplifier consists of a differential amplifier and a common-mode amplifier. The differential amplifier ensures that the amplifier outputs a differential voltage on the output that is equal to the differential input times the gain. The common-mode feedback ensures that the common-mode voltage at the output is biased around  $V_{\rm DD}/2$  regardless of the common-mode voltage at the input. The fully differential LY8005 can still be used with a single-ended input; however, the LY8005 should be used with differential inputs when in a noisy environment, like a wireless handset, to ensure maximum noise rejection.

## **Advantages of Fully Differential Amplifiers**

Input-coupling capacitors not required:

The fully differential amplifier allows the inputs to be biased at voltage other than mid-supply. For example, if a codec has a midsupply lower than the midsupply of the LY8005, the common-mode feedback circuit will adjust, and the LY8005 outputs will still be biased at midsupply of the LY8005. The inputs of the LY8005 can be biased from 0.5 V to VDD - 0.8 V. If the inputs are biased outside of that range, input - coupling capacitors are required.

Midsupply bypass capacitor, C(BYPASS), not required:

The fully differential amplifier does not require a bypass capacitor. This is because any shift in the midsupply affects both positive and negative channels equally and cancels at the differential output.

#### Better RF-immunity:

GSM handsets save power by turning on and shutting off the RF transmitter at a rate of 217 Hz. The transmitted signal is picked-up on input and output traces. The fully differential amplifier cancels the signal much better than the typical audio amplifier.

#### **Component Selection**

Figure 1 shows the LY8005 typical schematic with differential inputs and Figure 2 shows the LY8005 with single-ended inputs.

Differential inputs should be used whenever possible because the single-ended inputs are much more susceptible to noise.

Reference	Description	Note
Ri	150ΚΩ	1% tolerance resistors
Cs	1.0uF	+22%,-80%
Ci	3.3 nF	(±10%)

Table 1. Typical Component Values

(1) Ci is only needed for single-ended input or if VICM is not between 0.5 V and VDD - 0.8 V. CI = 3.3 nF (with Ri =  $150K\Omega$ ) gives a high-pass corner frequency of 321 Hz.

#### For example

 $fc = 1 / (2\pi RiCi)$ 

fc = 1 / ( $2\pi \times 150$ K $\Omega \times 3.3$ nF) = 321.524 Hz

Rev. 2.3

## 3.3 W Mono Filterless Class D Audio power Amplifier

#### Input Resistors (Ri)

The input resistors (Ri) set the gain of the amplifier according to equation Equation 1.

Pre-Amplifier Gain = 
$$\frac{150 \text{ k}\Omega}{\text{Ri}}$$

Total Gain =  $2 \times \frac{150 \text{ k}\Omega}{\text{Ri}}$ 

Avd =  $20 \times \log \left[2 \times \left(\frac{150 \text{ k}\Omega}{\text{Ri}}\right)\right]$ 

Ri

Resistor matching is very important in fully differential amplifiers. The balance of the output on the reference voltage depends on matched ratios of the resistors. CMRR, PSRR, and cancellation of the second harmonic distortion diminish if resistor mismatch occurs. Therefore, it is recommended to use 1% tolerance resistors or better to keep the performance optimized. Matching is more important than overall tolerance.

Resistor arrays with 1% matching can be used with a tolerance greater than 1%.

Place the input resistors very close to the LY8005 to limit noise injection on the high-impedance nodes. For optimal performance the gain should be set to 2 V/V or lower. Lower gain allows the LY8005 to operate at its best, and keeps a high voltage at the input making the inputs less susceptible to noise.

#### For example

Table 2. Typical Total Gain and AvD Values

		71				
Rf (KΩ)	150	150	150	150	150	150
Ri (KΩ)	150	75	50	37.5	25	18.75
Pre AMP. Gain	1	2	3	4	6	8
Total Gain	2	4	6	8	12	16
Avd (db)	6.02	12.04	15.56	18.06	21.58	24.08

#### **Decoupling Capacitor (CS)**

The LY8005 is a high-performance class-D audio amplifier that requires adequate power supply decoupling to ensure the efficiency is high and total harmonic distortion (THD) is low. For higher frequency transients, spikes, or digital hash on the line, a good low equivalent-series-resistance (ESR) ceramic capacitor, typically 1  $\mu$ F, placed as close as possible to the device VDD lead works best. Placing this decoupling capacitor close to the LY8005 is very important for the efficiency of the class-D amplifier, because any resistance or inductance in the trace between the device and the capacitor can cause a loss in efficiency. For filtering lower-frequency noise signals, a 10  $\mu$ F or greater capacitor placed near the audio power amplifier would also help, but it is not required in most applications because of the high PSRR of this device.

Rev. 2.3

## 3.3 W Mono Filterless Class D Audio power Amplifier

## Input Capacitors (Ci)

The LY8005 does not require input coupling capacitors if the design uses a differential source that is biased from 0.5 V to V<sub>DD</sub> - 0.8 V (shown in Figure 1). If the input signal is not biased within the recommended common-mode input range, if needing to use the input as a high pass filter (shown in Figure 1), or if using a single-ended source (shown in Figure 2), input coupling capacitors are required.

The input capacitors and input resistors form a high-pass filter with the corner frequency, fc, determined in equation Equation 2.

The value of the input capacitor is important to consider as it directly affects the bass (low frequency) performance of the circuit. Speakers in wireless phones cannot usually respond well to low frequencies, so the corner frequency can be set to block low frequencies in this application. Equation 3 is reconfigured to solve for the input coupling capacitance.

#### For example

In the table 3 shows the external components. Rin in connect with Cin to create a high-pass filter.

Table 3. Typical Component Values

Reference	Description	Note
Ri	150ΚΩ	1% tolerance resistors
Ci	0.22uF	80%/–20%

 $Ci = 1 / (2\pi Rifc)$ 

Ci = 1 / ( $2\pi \times 150 \text{K}\Omega \times 4.8 \text{Hz}$ )=0.221uF , Use 0.22uF

#### **Summing Input Signals With The LY8005**

Most wireless phones or PDAs need to sum signals at the audio power amplifier or just have two signal sources that need separate gain. The LY8005 makes it easy to sum signals or use separate signal sources with different gains. Many phones now use the same speaker for the earpiece and ringer, where the wireless phone would require a much lower gain for the phone earpiece than for the ringer. PDAs and phones that have stereo headphones require summing of the right and left channels to output the stereo signal to the mono speaker.

#### **Summing Two Single-Ended Input Signals**

Four resistors and three capacitors are needed for summing single-ended input signals. The gain and corner frequencies (fc1 and fc2) for each input source can be set independently (see equations Equation 11 through Equation 14, and Figure 14). Resistor, RP, and capacitor, CP, are needed on the IN+ terminal to match the

Rev. 2.3

## 3.3 W Mono Filterless Class D Audio power Amplifier

impedance on the IN- terminal. The single-ended inputs must be driven by low impedance sources even if one of the inputs is not outputting an ac signal.

Rev. 2.3

## 3.3 W Mono Filterless Class D Audio power Amplifier

#### **PCB Layout**

All the external components must place very close to the LY8005. The input resistors need to be very close to the LY8005 input pins so noise does not couple on the high impedance nodes between the input resistors and the input amplifier of the LY8005. Then place the decoupling capacitor Cs, close to the LY8005 is important for the efficiency of the class-D amplifier. Any resistance or inductance in the trace between the device and the capacitor can cause a loss in efficiency.

Making the high current traces going to VDD, GND, Vo+ and Vo- pins of the LY8005 should be as wide as possible to minimize trace resistance. If these traces are too thin, the LY8005's performance and output power will decrease. The input traces do not need to be wide, but do need to run side-by-side to enable common-mode noise cancellation.
